15/8/24 Exp: 8 NMAP to Discover live Hosts using Nmap
Scans (ARP, ICMP, TCP/UDP) on the Tryhackme Platform.

Aim: To study the working of the Nmap tool and discover live host in a network using different host discovery techniques such as ARP scanning

Steps:

1) open the Tryhackme platform and select the Nmap room.

2) Study the network topology and identify the source and destination hosts.

3) Use ARP request to discover the MAC address.

Host Discovery techniques:

i) ARP scan:

* Uses ARP requests to devices on the same subnet.
* Hosts responding with ARP replies are considered active

ii) Host TCP/UDP scan:

* TCP SYN ping sends SYN packets to selected ports
*

Observation:

ARP discovery:

* Active hosts respond with ARP replies
* Number of devices discovered using ARP

ICMP Discovery:

* Ping requests help identify active hosts
* ICMP scans may fail if firewalls block ICMP traffic.

Result:

Thus live host IP in the network were successfully using different NMP scanning techniques.

Output

ARP :

sud : nmap -AR -sn 10.10.200.0/24

Starting Nmap

Nmap scan report from 10.10.210.1

Host is up

Nmap done

Icmp

Nmap -P-S -Sn 10.10.210.0/24

starting Nmapap

Nmap scan report for 10.10.210.6

Host is up

nmap is done

TCP :

nmap - pS230 -Sn 10.10.210.0/24

sudo nmap PA80.Sn 10.10.210.0/24
